Written by Matthew Spiret. ASTM E8 / E8M is one of the most common test method for determining the tensile properties of metallic materials, with the other being ASTM A370. First released in 1924, it was originally named ASTM E8-24T and is the oldest actively-used standard for the testing of metals. As with most standards, ASTM E8 has often undergone frequent, minor changes.

1.2, The gauge lengths for most round specimens are required to be 4D for E8 and 5D for E8M. The gauge length is the most significant difference between E8 and E8M test specimens. Test specimens made from powder metallurgy (P/M) materials are exempt from this requirement by industry-wide agreement to keep the pressing of the material to a specific projected area and density.
