about the genetics of that trait, and it's a way to think about what's happened in the past in a family, and then maybe we can help get some probabilities or get some understanding of what might happen in the future.

A pedigree is a representation of our family tree. It shows how individuals within a family are related to each other. We can also indicate which individuals have a particular trait or genetic condition. If we take a pedigree, which we usually try to include at least three generations, we might be able to

determine how a particular trait is inherited.

This worksheet gives students a chance to practice identifying genotypes on pedigree charts. The pedigrees focus on human genetic diseases, such as

albinism, cystic fibrosis, tay-sachs, and sickle cell anemia. Some students do struggle with these charts, so I usually practice doing a few with them. If the parents are both heterozygous ($Aa \times Aa$) many students will be confused about the genotype of an offspring who does not have the disease.

Biology students learn to analyze pedigrees as part of a unit on genetics. Pedigrees are usually learned soon after students have a grasp of Punnett squares

and the concept of segregation. Some students will have an easy time with pedigrees, depending on how well they understood genetic crosses. In this activity, students are introduced to the concept of a pedigree of a family and they practice determining the genotypes of family
