Interpreting the box and whisker plot results: The box and whisker plot shows that 50% of the students have scores between 70 and 88 points. In addition, 75% scored lower than 88 points, and 50% have test results above 80. So, if you have test results somewhere in the lower whisker, you may need to study more.

Box and Whisker Plots are graphs that show the distribution of data along a number line. We can construct box plots by ordering a data set to find the median of the set of data, median of the upper and lower quartiles, and upper and lower extremes. We can draw a Box and Whisker plot and use box plots to solve a real world problem.

The process to abstract a set of data which is estimated using an interval scale is called a box and whisker plot. It is also called just a box plot. These are mostly used for data interpretation. We use these box plots or graphical representation to know: Distribution Shape; Central Value; Variability; When we plot a graph for the box plot, we outline a box from the first quartile to the third quartile. A vertical line which goes through the box is the median.

These "too far away" points are called "outliers", because they "lie outside" the range in which we expect them. The IQR is the length of the box in your box-and-whisker plot. An outlier is any value that lies more than one and a half times the length of the box from either end of the box. Content Continues Below.

Sample Problems. In this box and whisker plot, the interquartile range is $3 - 1 = 2$. Meanwhile, if the quartiles are . $Q_1 = 4$ $Q_2 = 9$ $Q_3 = 10$. then the interquartile range is. $IQR = Q_3 - Q_1 = 10 - 4 = 6$. For a box and whisker plot, we start at the edges of the box, go 1.5 times the width of the box in either direction, and draw the inner fences. These are the electrified ones that will keep out any unwanted, snooping values.

By definition, the box-plot limits the size of the whiskers to 1.5 times the interquartile range $\backslash(IQR\backslash)$ from the ends of the box (which are defined by $\backslash(Q_1\backslash)$ and $\backslash(Q_3\backslash)$). So, then, any points that go beyond of the maximum size of the whiskers will be annotated in the box-plot and it will be considered an outlier.

Mark your median and quartile values from Steps 2 through 4 and construct the box. Make points for your median and quartile values. Draw a box spanning from the first quartile (Q 1) to the third quartile (Q 3) and draw a vertical line in the box corresponding to the median value. Add the minimum and maximum values from Step 5 and construct the whiskers.
