Comparative Vertebrate Neuroanatomy: Evolution and ...
Although comparative neurobiologists have been relatively successful in establishing what changes characterize brain evolution in vertebrates, and even when these changes occurred, there has been little progress in understanding how and why such changes occurred. This is in part due to an erroneous approach to assessing these changes.

Since many DA cell clusters are well conserved in craniates, the roots of the evolution of the vertebrate DA systems have to be searched outside vertebrates. Previous studies in the two sister groups of non-craniate chordates, i.e., urochordates (ascidians and larvaceans) and cephalochordates (amphioxus), have shown that the two groups exhibit DA-containing cells in their CNS (Moret et al ...
