This book describes in detail three different techniques for minimally invasive video-assisted breast surgery: nipple-sparing mastectomy with a hand-held external retractor, with a single-port device, and with robotic assistance. All three techniques can be employed for radical treatment of breast cancer or for risk reduction surgery, and the last two are brand new. The techniques are clearly explained with the aid of numerous high-quality illustrations. All surgical stages are covered in detail, and helpful information is provided on key aspects of surgical anatomy, diagnostic workup, instrumentation, and postoperative management. Nipple Sparing Mastectomy is the first manual to cover these techniques, which are likely to become standard in the field of oncological breast surgery. It will be invaluable for breast surgeons who are skilled in nipple-sparing mastectomy and oncoplastic techniques or are working in breast units that offer genetic counseling to high-risk patients.

In breast reconstruction, flap based procedures and implant based procedures are the two major modalities that have emerged as surgical options for patients. These are both continuing to evolve as new, innovative techniques help to improve outcomes and patient satisfaction. This book is divided into four sections. The first section includes overviews of mastectomy options and considerations in breast reconstruction procedure selection. The next section comprises non microsurgical reconstruction options which include implant based reconstruction refinements, the emerging role of fat grafting, and a novel technique of robotic latissimus flap harvesting. The third section is devoted to microsurgical reconstruction including flap refinements, tips and tricks, as well as advice on handling difficult situations. The final section includes the growing field of lymphedema surgery which is an important addition to breast reconstruction.

This book presents the most recent developments in oncologic breast surgery and takes full account of diagnostic, pathologic, and radiologic inputs. It is divided into three parts, the first of which discusses the premises underlying the modern surgical approach to breast cancer. The second part is devoted to what might be termed the conservative program, i.e., breast conservation and oncoplastic surgery, conservative mastectomy, and sentinel node biopsy and axillary dissection. The final part of the book covers different forms of surgery and other treatments in particular settings. Topics include plastic and reconstructive surgery, DCIS surgery, radio-guided surgery, adjuvant systemic therapy, intraoperative radiotherapy, and the role of surgery in locally advanced and metastatic disease. The detailed descriptions of techniques are accompanied by numerous high-quality illustrations. This book will be of value to both experienced practitioners and surgical trainees.

The new edition includes increased video/DVD coverage, new chapters on BRAVA tissue expansion, flaps, and increased detail on mega-filling the breast with fat. The book is published with a bundled eBook, which includes an image library so all the images can be downloaded.

Oncoplastic and Reconstructive Management of the Breast, Third Edition provides a comprehensive and contemporary account of techniques in oncoplastic and reconstructive breast surgery. Many of the chapters are entitled "My Approach" and this enables the reader to gain an insight into the clinical practice of the world's breast disease experts.
