Four-stroke cycle used in gasoline/petrol engines: intake (1), compression (2), power (3), and exhaust (4). The right blue side is the intake port and the left brown side is the exhaust port. The cylinder wall is a thin sleeve surrounding the piston head which creates a space for the combustion of fuel and the genesis of mechanical energy.

Four stroke spark ignition engine is also known as the petrol engine and is widely used in bikes and cars as the power unit. It converts the chemical energy of fuel into mechanical energy by the piston. By knowing the working of this engine we can able to find out why our vehicle is not working properly.

How does a Four Stroke Petrol Engine Works? - Mechanical ...

Mechanical fuel injection is easily configurable from small setups to very large power outputs. Small 4-cylinder engines making 100 horsepower are easy to do in midget racing. On the other end of the spectrum, MFI is a staple of the huge 10,000-plus horsepower engines in NHRA 's Top Fuel and Funny Car applications.

What You Need To Know About Mechanical Fuel Injection

(i). Single cylinder engine: An engine which consists of single cylinder is called single cylinder engine. Generally the single cylinder engines are used in motorcycles, scooter, etc. (ii). Double cylinder engine: The engine which consists of two cylinders is called double cylinder engine. (iii). Multi cylinder engine: An engine which consists of more than two cylinders is called multi cylinder engine. The multi cylinder engine may have three, four, six, eight, twelve and sixteen cylinder.

1. ENGINE TESTING 1.1 FUEL POWER (F.P.) Fuel power is the thermal power released by burning fuel inside the engine. F.P. = mass of fuel burned per second x calorific value of the fuel. F.P. = mf x C.V. All engines burn fuel to produce heat that is then partially converted into mechanical power. The chemistry of combustion is not dealt with here.

The normal engine completes around 100000 cycles per minute, as we know there are number of processes involved in a single cycle (from the intake of the air-fuel mixture to the exhaust of the combustion residual) of an internal which makes it necessary to be equipped with an effective system that can enable

The petrol engine works on Otto cycle i.e. on constant volume. The diesel engine works on diesel cycle i.e. on constant pressure. 2. The air and petrol are mixed in the carburetor before they enter into the cylinder. The fuel is fed into the cylinder by a fuel injector and is mixed with hot compressed air inside the cylinder.

What is Difference Between Petrol and Diesel Engine ...

A two-stroke (or two-cycle) engine is a type of internal combustion engine that completes a power cycle with two strokes (up and down movements) of the piston during only one crankshaft revolution. This is in contrast to a " four-stroke engine ", which requires four strokes of the piston to complete a power cycle during two crankshaft revolutions.
