Spatial memory can be utilized in working memory, also called short-term memory, or in long-term memory. When you see something with your eyes, that information is transferred to iconic memory, a form of ultra-short-term sensory memory. From the sensory memory, that information is passed on to the short-term memory, or working memory.

In this paper, we are interested in the location prediction problem in a weak real time condition and aim to predict users' movement in next minutes or hours. We propose a Spatial- Temporal Long-Short Term Memory (ST-LSTM) model which naturally combines spatial-temporal inuence into LSTM to mitigate the problem of da- ta sparsity.

This hypothesis is in concordance with the theory that short-term and long-term memory depend on dissociable psychological processes. In this study we tested GluA1 $-/-$ mice on both short-term and long-term spatial memory using a simple novelty preference task. Mice were given a series of repeated exposures to a particular spatial location (the arm of a Y-maze) before their preference for a novel spatial location (the unvisited arm of the maze) over the familiar spatial location was assessed.
